

AEL - Product Requirements Document (first draft)

Agentic Platform for the Handbook, Group 3: Tanishq Bhaiji, Nikola Hadzhiminov, Valentina Petrušić, Tanjin Rahman Rafi, Anisah Sakura Sutrisno

- 1. Problem and users:** STMG's "planning" problem is that caretakers know their day's route, but clients often aren't told in advance whether or when someone is coming, leaving an already-anxious client group unnecessarily surprised. STMG's current planning system is causing more unnecessary phone calls that are resulting in more workload and makes things less organised. Could AI close that gap, and how?

Users: our five-person team, directing the platform through an agentic CLI (without coding) downstream, STMG's management, reading the published chapters, and the peer team, who judge the platform on whether it works and the chapters on the research.

- 2. What it must let a user do:** Raw material in, published chapter out, as steps a non-coder can run one at a time, checking the output before continuing:
 1. Intake this week's material, e.g interview notes/audio, CBS/KvK/sector links, press, Dutch or English.
 2. Retrieve further sources, in English, for that week's theme.
 3. Appraise each source (publisher, recency, relevance) before it's used.
 4. Draft the chapter in the handbook's fixed anatomy: the question narrowed to STMG's size and sector, a plain-language translation, a CRISP-DM illustrative use case, tooling options, responsible-AI/trust notes, five first steps for the owner, sources.
 5. Human review and edit.
 6. Publish to the shared handbook site.

- 3. Output qualities:**

A good handbook page should be clear, practical and easy to understand for STMG employees and management, even if they have little knowledge of AI. It should explain how AI could help with planning caretaker visits and informing elderly clients, without using too much technical language. The information should be based on reliable sources and our research at STMG. Each page should clearly explain the problem, possible AI solutions, costs and requirements, risks such as privacy and GDPR, and the role of employees. It should also give practical recommendations and clear first steps that STMG can actually use.

4. **Known constraints:** We direct an agentic CLI. We don't hand-code the platform. We publish into the existing handbook site no new infrastructure.
5. **Crossing the Dutch gap:** Retrieval runs queries in Dutch and English, since most of STMG's own material, its Chamber of Commerce record, and regional coverage exist only in Dutch. The Interview audio is transcribed in Dutch first, then translated to English to be able to always credibly check a quoted claim. Anyone who reads Dutch can still verify or override a translation by hand.
6. **Out of scope, for now:** Automating the STMG interview itself, generalising beyond this one SME, and automated final publish sign-off; a human always approves before a chapter goes live.
7. **Open questions and assumptions**
 - Assuming "the existing wiki and site" is this course's own handbook site; still need to confirm how our team actually publishes into it (git push vs. an editor).
 - STMG isn't formally confirmed as our field-research partner until - this PRD assumes it holds.
 - Open: how much interview access and client-data consent STMG will actually give us, which bounds how concrete the illustrative use case can get.
 - Assuming our AIBS research proposal's quality criteria and this PRD's output qualities end up identical
